

DANISH STUDY OS v4

Development Rules

Rule 1 — Source of Truth

The Vision Document, Roadmap, Features Specification, Wireframe, and Current Tasks documents are the official source of truth.

Rule 2 — Architecture First

Always design architecture, database schema, and user flows before writing production code.

Rule 3 — Firebase First

Use Firebase Auth, Firestore, Firebase Storage, and Firebase Hosting as the default platform architecture.

Rule 4 — Multi-User Ready

Every feature must support multiple users from the beginning. All data must be scoped to a user account.

Rule 5 — Full File Replacements

Provide complete file replacements whenever code changes are requested. Avoid patches and partial edits.

Rule 6 — Preserve Features

Never remove existing features without explicit approval. Always report Features Preserved, Features Added, and Features Removed.

Rule 7 — Dynamic Architecture

Never hardcode Python, Cyber Security, BPSC, or any specific subject. Use Category → Task → Resource architecture.

Rule 8 — Cloud Storage

Store important user data in Firestore. LocalStorage may only be used for temporary caching or offline support.

Rule 9 — Security First

Implement Firebase Security Rules so users can only access their own data.

Rule 10 — Mobile Friendly

All interfaces must be responsive and usable on mobile devices.

Rule 11 — Learning Hub Standard

Every category automatically receives Resources, Notes, Questions, Flashcards, Knowledge, Progress, and Roadmap sections.

Rule 12 — Scalability

Design collections, components, and architecture to support thousands of users without redesign.

Rule 13 — Feature Tracking

Update the Features Specification document whenever a new feature is added or removed.

Rule 14 — Build by Phases

Develop one roadmap phase at a time. Complete, test, and approve before moving to the next phase.

Rule 15 — Future Expansion

Architecture must support future AI features, Desktop App, Mobile App, Offline Mode, and Cloud Sync.
